#### **7.3.2 Test conditions**

*Replace the existing text of this subclause by the following:*

In this test, the two ignitors are connected as in normal use, each associated with appropriate control gear. The test voltage shall correspond to 1,06 times the rated supply voltage of the control gear. The ignitors are operated in conformity with their marking at the maximum case temperature  $t_c$  and without lamp. In doing so, the live connections of one of the ignitors are loaded by the maximum allowable load capacitance, whilst the connections of the other ignitors are left unloaded.

The control gear used in the life test shall comply with the requirements specified in Annex A. Control gear that fail during the endurance test are replaced.

Ignitors intended to be connected in series with discharge lamps are tested additionally under conditions with maximum case temperature brought to  $t_c$  and loaded with the rated current of the lamp. For ignitors which are intended for the use of different lamps, the highest value of the current shall be used.
