This European Standard was approved by CENELEC on 2014-08-04. CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CENELEC member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Foreword

This document (EN 62566:2014) consists of the text of IEC 62566:2012 prepared by SC 45A "Instrumentation, control and electrical systems of nuclear facilities" of IEC/TC 45 "Nuclear instrumentation".

The following dates are fixed:

- latest date by which this document has to be implemented (dop) 2015-08-04
at national level by publication of an identical
national standard or by endorsement
- latest date by which the national standards conflicting (dow) 2017-08-04
with this document have to be withdrawn

As stated in the nuclear safety directive 2009/71/EURATOM, Chapter 1, Article 2, item 2, Member States are not prevented from taking more stringent safety measures in the subject-matter covered by the Directive, in compliance with Community law. In a similar manner, this European standard does not prevent Member States from taking more stringent nuclear safety measures in the subject-matter covered by this standard.

Endorsement notice

The text of the International Standard IEC 62566:2012 was approved by CENELEC as a European Standard without any modification.

Annex ZA

(normative)

Normative references to international publications with their corresponding European publications

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

NOTE 1 When an international publication has been modified by common modifications, indicated by (mod), the relevant EN/HD applies.

NOTE 2 Up-to-date information on the latest versions of the European Standards listed in this annex is available here: www.cenelec.eu.

About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

Useful links:

IEC publications search - www.iec.ch/searchpub

The advanced search enables you to find IEC publications by a variety of criteria (reference number, text, technical committee,...).

It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available on-line and also once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing more than 30 000 terms and definitions in English and French, with equivalent terms in additional languages. Also known as the International Electrotechnical Vocabulary (IEV) on-line.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**NUCLEAR POWER PLANTS –
INSTRUMENTATION AND CONTROL IMPORTANT TO SAFETY –
DEVELOPMENT OF HDL-PROGRAMMED INTEGRATED CIRCUITS
FOR SYSTEMS PERFORMING CATEGORY A FUNCTIONS**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62566 has been prepared by subcommittee 45A: Instrumentation and control of nuclear facilities, of IEC technical committee 45: Nuclear instrumentation.

The text of this Standard is based on the following documents:

FDIS	Report on voting
45A/859/FDIS	45A/865/RVD

Full information on the voting for the approval of this Standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

INTRODUCTION

a) Technical background, main issues and organisation of the Standard

The electronic systems of class 1 (according to IEC 61513) used in Nuclear Power Plants (NPP) which are required in emergency situations, need to be fully validated and qualified before being used in operation.

In traditional systems that are computer-based, a separation can be drawn between the hardware and software portions. The hardware is mainly designed with standardised components having pre-defined electronic functions such as microprocessors, timers or network controllers, whereas software is used to coordinate the different parts of the hardware and to implement the application functions.

Nowadays, I&C designers may build application functions directly in one integrated circuit using devices such as FPGAs or similar technologies. The function of such an integrated circuit is not defined by the supplier of the physical component or micro-electronic technology but by the I&C designer.

The specific integrated circuits addressed by this Standard are:

- 1) based on pre-developed micro-electronic resources,
- 2) developed within an I&C project,
- 3) developed with Hardware Description Languages (HDL) and related tools used to implement the requirements in a proper assembly of the pre-developed micro-electronic resources.

Therefore these circuits are named “HDL-Programmed Devices”, (HPD). The HDL statements which describe a HPD can include the instantiation of Pre-Developed Blocks (PDB) which are typically provided as libraries, macros, or Intellectual Property cores.

HPDs can be effective solutions to implement functions required by an I&C project. However, the verification and validation may be limited by issues such as high number of internal paths and limited observability, if the HPD has not been developed with verifiability in mind.

In order to achieve the reliability required for safety I&C systems, the development of HPDs shall comply with strict process and technical requirements such as those provided by this Standard, including the specification of requirements, the selection of blank integrated circuits and PDBs, the design and implementation, the verification, and the procedures for operation and maintenance.

It is intended that this Standard be used by hardware designers, operators of NPPs (utilities), and by regulators. Regulatory bodies will find guidance to assess important aspects such as design, implementation, verification and validation of HPDs.

b) Situation of the current Standard in the structure of the IEC SC 45A Standard series

IEC 61513 is a first level IEC SC 45A document and gives guidance applicable to I&C at system level. It is supplemented by guidance at hardware level (IEC 60987) and software level (IEC 60880 and IEC 62138). IEC 62340 gives requirements in order to reduce and overcome the possibility of common cause failure of category A functions.

IEC 62566 is a second level IEC SC 45A document which focuses on the activities when HPDs are developed. It complements IEC 60987 which deals with the generic issues of hardware design of computer based systems. It refers to IEC 60880 when issues identical to that of software development are addressed.

For more details on the structure of the IEC SC 45A Standard series, see item d) of this introduction.

c) Recommendations and limitations regarding the application of the Standard

It is important to note that this Standard establishes no additional functional requirements for safety systems.

Aspects for which special requirements and recommendations have been produced are:

- 1) an approach to specify the requirements of, to design, to implement and to verify “HDL-Programmed Devices” (HPD, 3.7), and to handle the corresponding aspects of system integration and validation;
- 2) an approach to analyse and select the blank integrated circuits, micro-electronic technologies and Pre-Developed Blocks (PDB, 3.11) used to develop HPDs;
- 3) procedures for the modification and configuration control of HPDs;
- 4) requirements for selection and use of software tools used to develop HPDs.

It is recognized that digital technology is continuing to develop at a rapid pace and that it is not possible for a Standard such as this one to include references to all modern design technologies and techniques.

To ensure that the Standard will continue to be relevant in future years the emphasis has been placed on issues of principle, rather than specific technologies. If new techniques are developed then it should be possible to assess the suitability of such techniques by applying the safety principles contained within this Standard.

d) Description of the structure of the IEC SC 45A Standard series and relationships with other IEC documents and other bodies documents (IAEA, ISO)

The top-level document of the IEC SC 45A Standard series is IEC 61513. It provides general requirements for I&C systems and equipment that are used to perform functions important to safety in NPPs. IEC 61513 structures the IEC SC 45A Standard series.

IEC 61513 refers directly to other IEC SC 45A Standards for general topics related to categorization of functions and classification of systems, qualification, separation of systems, defence against common cause failure, software aspects of computer-based systems, hardware aspects of computer-based systems, and control room design. The Standards referenced directly at this second level should be considered together with IEC 61513 as a consistent document set.

At a third level, IEC SC 45A Standards not directly referenced by IEC 61513 are Standards related to specific equipment, technical methods, or specific activities. Usually these documents, which make reference to second-level documents for general topics, can be used on their own.

A fourth level extending the IEC SC 45 Standard series, corresponds to the Technical Reports which are not normative.

IEC 61513 has adopted a presentation format similar to the basic safety publication IEC 61508 with an overall safety life-cycle framework and a system life-cycle framework and provides an interpretation of the general requirements of IEC 61508-1, IEC 61508-2 and IEC 61508-4, for the nuclear application sector. Compliance with IEC 61513 will facilitate consistency with the requirements of IEC 61508 as they have been interpreted for the nuclear industry. In this framework IEC 60880 and IEC 62138 correspond to IEC 61508-3 for the nuclear application sector.

IEC 61513 refers to ISO as well as to IAEA GS-R-3 and IAEA GS-G-3.1 for topics related to quality assurance.

The IEC SC 45A Standards series consistently implements and details the principles and basic safety aspects provided in the IAEA code on the safety of NPPs and in the IAEA safety series, in particular the Requirements NS-R-1, establishing safety requirements related to the design of Nuclear Power Plants, and the Safety Guide NS-G-1.3 dealing with instrumentation and control systems important to safety in Nuclear Power Plants. The terminology and definitions used by SC 45A Standards are consistent with those used by the IAEA.

NUCLEAR POWER PLANTS – INSTRUMENTATION AND CONTROL IMPORTANT TO SAFETY – DEVELOPMENT OF HDL-PROGRAMMED INTEGRATED CIRCUITS FOR SYSTEMS PERFORMING CATEGORY A FUNCTIONS

1 Scope and object

1.1 General

This International Standard provides requirements for achieving highly reliable “HDL-Programmed Devices” (HPD), for use in I&C systems of nuclear power plants performing functions of safety category A as defined by IEC 61226.

The programming of HPDs relies on Hardware Description Languages (HDL) and related software tools. They are typically based on blank FPGAs or similar micro-electronic technologies. General purpose integrated circuits such as microprocessors are not HPDs.

This Standard provides requirements on:

- a) a dedicated development life-cycle addressing each phase of the development of HPDs, including specification of requirements, design, implementation, verification, integration and validation,
- b) planning and complementary activities such as modification and production,
- c) selection of pre-developed components. This includes micro-electronic resources (such as a blank FPGA or CPLD) and HDL statements representing Pre-Developed Blocks (PDB),
- d) use of simplicity and deterministic principles, recognized to be of primary importance to achieve “fault free” implementation of category A functions,
- e) tools used to design, implement and verify HPDs.

This Standard does not put requirements on the development of the micro-electronic resources, which are usually available as “commercial off-the-shelf” items and are not developed under nuclear quality assurance Standards. It addresses the developments made with these micro-electronic resources in an I&C project with HDLs and related tools.

This Standard provides guidance to avoid as far as possible latent faults remaining in HPDs, and to reduce the susceptibility to single failures as well as to potential Common Cause Failures (CCF). The requirements within this Standard for clear and comprehensive documentation should facilitate the effective application of IEC 62340.

Reliability aspects related to environmental qualification and failures due to ageing or physical degradation are not handled in this Standard. Other Standards, especially IEC 60987, IEC 60780 and IEC 62342, address these topics.

Subclause 5.7 of IEC 60880:2006 provides security requirements that apply to the development of HPDs as applicable.

1.2 Use of this Standard

This Standard provides guidance and requirements to produce verifiable designs and implementations where justification is necessary due for example to the function performed or to the importance to safety of its behaviour. Class 1 I&C systems may use HPDs for which full demonstration of compliance with the requirements of this Standard is not mandatory, e.g.

when they do not implement the logic of a safety function. However, deviations from this Standard should be justified.

This Standard describes the activities to develop HPDs, organized in the framework of a dedicated life-cycle. It also describes activities and guidelines to be used in addition to the requirements of IEC 61513 for system integration and validation when HPDs are included.

Those requirements of IEC 60987 that relate to programmable logic device development are applicable, in addition to those of this Standard, where HPDs are part of class 1 I&C systems.

NOTE In case of conflicting requirements, this Standard supersedes those in IEC 60987 about class 1 HPDs.
