English Version

Public transport - Road vehicle scheduling and control systems - Part 8: Physical layer for IP communication

Transport public - Systèmes de planification et de contrôle des véhicules routiers - Partie 8: Couche physique pour communication IP

Öffentlicher Verkehr - Planungs- und Steuerungssysteme für Straßenfahrzeuge - Teil 8: Physikalische Schicht für IP-Kommunikation

This Technical Specification (CEN/TS) was approved by CEN on 18 May 2013 for provisional application.

The period of validity of this CEN/TS is limited initially to three years. After two years the members of CEN will be requested to submit their comments, particularly on the question whether the CEN/TS can be converted into a European Standard.

CEN members are required to announce the existence of this CEN/TS in the same way as for an EN and to make the CEN/TS available promptly at national level in an appropriate form. It is permissible to keep conflicting national standards in force (in parallel to the CEN/TS) until the final decision about the possible conversion of the CEN/TS into an EN is reached.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Foreword

This document (CEN/TS 13149-8:2013) has been prepared by Technical Committee CEN/TC 278 "Intelligent transport systems", the secretariat of which is held by NEN.

EN 13149, *Public transport — Road vehicle scheduling and control systems*, is composed of the following parts:

- Part 1: WORLDFIP definition and application rules for onboard data transmission;

- Part 2: WORLDFIP cabling specifications;

- Part 3: WorldFIP message content (CEN/TS 13149-3);

- Part 4: General application rules for CANopen transmission buses;

- Part 5: CANopen cabling specifications;

- Part 6: CAN message content (CEN/TS 13149-6);

- Part 8: Physical layer for IP communication (CEN/TS 13149-8; the present document).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to announce this Technical Specification: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Introduction

The Technical Specifications in the EN 13149 series provide rules for data communication systems on-board public transport vehicles. Part 8 together with part 7 and part 9 describes a complete solution parallel to, but independent of, parts 1-3 and part 4-6.

Public Transport (PT) vehicles have an increasing array of information and communications systems, including ticket machines, Automated Vehicle Location (AVL) systems, destination displays, passenger announcement systems, vehicle monitoring systems etc. Other systems are beginning to be included such as advertising screens, tourist guides, WiFi "hotspots" and infotainment.

These systems may be provided by a number of different suppliers, and may need to be integrated. For instance a ticket machine may need location information to update fare stages; next-stop and destination information may be drawn from schedule information held in the ticket machine; and location systems may be used to drive signal priority requests.

In addition, equipped PT vehicles will often have communications facilities to enable voice and/or data to be exchanged with the intermodal transport control system centre, other PT vehicles, PT infrastructure, and roadside devices (for instance in requesting priority at traffic signals). Many types of communication channel are utilised, including public and private wireless communication networks.

Without a clear technology framework, integrating these systems would require complex technical discussions every time a device is procured.

A large number of current and future communication networks will use the Internet Protocol (IP) as a core network technology. Existing parts of EN 13149 are not consistent with an IP network and do not support the use of associated protocols. This makes it difficult for integrated on-board systems to use modern networks efficiently.

If an IP approach is adopted, the PT vehicle begins to look like a local area network (LAN) of connected systems. In this context it is relevant to define a hardware network which makes use of IEEE 802 technologies – these are much the most widespread basis for IP LANs worldwide.

The parts 7 to 9 will describe this adaptation. This will facilitate:

— high quality intermodal passenger services based on intermodal PT information,

— integration of new PT services,

— lower cost, lower risks and a smoother onboard integration of PT equipment,

— more efficient operation and maintenance of onboard PT equipment, and

— more efficient development of PT components.

1 Scope

This Technical Specification specifies the physical layer of an onboard data transmission bus between the different equipment for service operations and monitoring of the fleet. This applies to equipment installed on board vehicles that are operating as part of a public transport network, i.e. in operation under public service contracts. This equipment includes operation aid systems, automatic passenger information systems, fare collection systems, etc.

Equipment directly related to the safety-related functioning of the vehicle (propulsion management, brake systems, door opening systems, etc...) are excluded from the scope of this Technical Specification and are dealt with in other standardization bodies. Interfaces to such equipment or safety-critical networks can be provided through dedicated gateways.

Part 8 covers the link between equipment inside vehicles consisting of one carriage only, e.g. buses and trolleybuses, as well as a set of carriages, e.g. trams and trains.

For the described application, three communication systems are standardised under EN 13149. There is no ranking between the three communication systems.

— Parts 1, 2 and 3 describe the WORLDFIP communication system;

— Parts 4, 5 and 6 describe the CANopen communication system;

— Parts 7, 8 and 9 describe the IP-based communication system.

Part 7[1] of the 13149 series specifies the **Network and System Architecture** for onboard equipment. It describes basic principles of communications including a general description of the network topology, addresses schematics, basic network services, a system overview and basic device architecture.

Part 8 of the 13149 series specifies the **Physical Layer for IP-communication** networks onboard PT vehicles. This part specifies the cables, connectors and other equipment including pin assignment and environmental requirements.

Part 9[2] of the 13149 series specifies in detail the **Profiles** of basic and generic **Services and Devices** as well as profiles of specific services and devices.

This part 8-1 specifies wired communication networks onboard PT vehicles which are based on the Ethernet specification IEEE 802.3 — 10 Base T and 100 Base Tx.
