English Version

## Water quality - Technical report for the management of diatom barcodes

Qualité de l'eau - Rapport technique relatif à la gestion des codes barres Diatomées pour l'évaluation du statut écologique

Wasserbeschaffenheit - Technischer Bericht zur Erstellung und Verwaltung von Diatomeen Barcodes

This Technical Report was approved by CEN on 14 May 2018. It has been drawn up by the Technical Committee CEN/TC 230.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

## **European foreword**

This document (CEN/TR 17244:2018) has been prepared by Technical Committee CEN/TC 230 “Water analysis”, the secretariat of which is held by DIN.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

**CEN/TR 17244:2018 (E)****Introduction**

**WARNING** — Persons using this technical report should be familiar with normal laboratory practice. This European technical report does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user to establish appropriate health and safety practices and to ensure compliance with any national regulatory conditions.

Diatoms are unicellular microalgae present in all types of water bodies. They are an important component of aquatic ecosystems and have been used widely for ecological assessment required by the Water Framework Directive (2000/60/EC) and Urban Waste Water Treatment Directive (91/217/EEC) in addition to other EU Directives and international agreements. The use of diatoms as indicators of water quality is based on observations that diatom taxa have distinct preferences for particular environmental conditions such as nutrients, organic pollution and acidity. Polluted waters will tend to support higher proportions of those taxa whose optima correspond with the levels of the pollutant in question. Conversely, certain species are intolerant of elevated levels of one or more pollutants, whilst others may occur in a wide range of water qualities.

Methods using diatoms to assess water quality and ecological status based on optical microscopy have been developed in several European countries. Methods for sampling and preparation are similar [4], [8] leading to the development of European Standards which, in turn, facilitated the harmonization of ecological assessment approaches [5], [6], [1]. More recently, however, molecular biology has presented new opportunities for assessment of ecological status using diatoms (e.g. [7], [10]). Such procedures, however, are not covered by existing standards.

A database of validated barcodes is an essential foundation of any assessment system that uses molecular data to determine the identities of organisms. This technical report covers the steps that should be taken if a barcode is to be correctly assigned to the appropriate taxon in a manner that can be readily checked and authenticated by other users. These instructions will enable method developers to ensure that they have provided all of the metadata necessary to validate the identity of a barcode and, if followed, will ensure that reliable identifications can be made from environmental samples.

According to the precise usage to which this technical report is to be put it is essential for specifiers and users to mutually agree on any necessary variations or optional procedural details prior to use.

All numerical values given in this technical report are approximate.

## **1 Scope**

This technical report specifies the data and metadata necessary to validate the identity of a diatom barcode used for ecological assessment along with recommendations for storage of the barcode and metadata to ensure access to this information.

## **2 Normative references**

There are no normative references in this document.
