## **European foreword**

This document (CEN/TR 17509:2020) has been prepared by Technical Committee CEN/TC 366 "Materials obtained from End-of-Life Tyres (ELT)", the secretariat of which is held by UNI.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

## Introduction

During the production of materials obtained from end-of-life tires (ELTs), maintenance of quality levels is based on the control of characteristics such as particle size distribution, steel and textile content. Particularly important is this last parameter. Its determination can be based on the method described in the EN 14243 series, but this test exhibits difficulties when the textile content is high and part of the fibres are bound to the rubber.

For this reason, for granulates there is a need to define an alternative approach capable of characterizing the content of textile fibres, free and bounded. This characterization is especially useful as a quick control that detects quality deviations during the production process and for the acceptance of the materials by consumers.

## 1 Scope

The purpose of this document is to provide information about a procedure based on the determination of a visual index correlated with the content of textile fibres, which are free and bounded to the rubber, of granulates. This approach is currently used by Spanish grinders in order to control the efficiency of their processes and is effective for granulates with particle sizes the bottom limit of which is more than 0,5 mm, and upper limit less than 10 mm.

NOTE Part of this document is also the presentation of a study carried by Valoriza Servicios Medioambientales and Geneus Canarias S.L.

A test procedure for the determination of a visual index of the content of the textile fibre of a granulate sample, which is free and bounded to the rubber, from the ELT's processing is described in UNE 53936:2015 *EX: Materials produced from end of life tyres. Rubber granulates.*
