ICS 13.040.20

Supersedes EN 14662-1:2005

English Version

## Ambient air quality - Standard method for measurement of benzene concentrations - Part 1: Pumped sampling followed by thermal desorption and gas chromatography

Qualité de l'air ambiant - Méthode normalisée pour le mesurage de la concentration en benzène - Partie 1 : Prélèvement par pompage suivi d'une désorption thermique et d'une chromatographie en phase gazeuse

Außenluft - Verfahren zur Messung von Benzolkonzentrationen - Teil 1: Probenahme mit einer Pumpe, gefolgt von Thermodesorption und Gaschromatographie

This European Standard was approved by CEN on 20 November 2023.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and United Kingdom.

**EN 14662-1:2023 (E)****European foreword**

This document (EN 14662-1:2023) has been prepared by Technical Committee CEN/TC 264 "Air quality", the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by June 2024, and conflicting national standards shall be withdrawn at the latest by June 2024.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN 14662-1:2005.

In comparison with the previous edition, the following technical modifications have been made:

- inclusion of the option of multi-tube sampling devices such that a series of samples can be collected sequentially and/or in parallel without user intervention in the field;
- specification of associated 'type testing' requirements to allow multi-tube sampling devices to be tested and approved;
- inclusion of gas standard calibration options, alongside liquid spiking, in line with best practice;
- extensive updates to technical aspects, including uncertainty calculations, in line with the latest standards.

Any feedback and questions on this document should be directed to the users' national standards body. A complete listing of these bodies can be found on the CEN website.

According to the CEN-CENELEC Internal Regulations, the national standards organisations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and the United Kingdom.

## 1 Scope

This document gives general guidance for the sampling and analysis of benzene in air by pumped sampling, thermal desorption and capillary gas chromatography.

This document is in accordance with the generic methodology selected as the basis of the European Union reference method for the determination of benzene in ambient air [1] for the purpose of comparison of measurement results with limit values with a one-year reference period.

This document is valid for the measurement of benzene in a concentration range of approximately 0,5 µg/m<sup>3</sup> to 50 µg/m<sup>3</sup>. Air samples are typically collected over periods ranging from a few hours to 7 days.

The upper limit of the useful range is set by the sorptive capacity (the safe sampling volume) of the sorbent and by the linear dynamic range of the gas chromatograph column and detector or by the sample splitting capacity of the analytical instrumentation used. The lower limit of the useful range depends on the noise level of the detector and on blank levels of benzene and/or interfering artefacts on the sorbent. Artefacts are typically sub ng for graphitised carbon sorbents, but higher levels of aromatic hydrocarbons have been noted in other sorbents – e.g. porous polymers. The detection limit will be approximately 1/10 of the lower concentration range.

This document provides general guidance for the sampling of benzene using either a single sampling device, which is changed manually after every exposure period, or sequential sampling device capable of storing and exposing multiple samples without user intervention. The analysis methods are diverse, but a suitable approach for analysing samples and blanks and calculating benzene levels is described in Annex B.

NOTE The method described in this document can be used for the determination of other compounds besides benzene, under the condition of documented validation tests.

## 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.
