STN	Ochrana ovzdušia Hodnotenie zariadení na monitorovanie kvality ovzdušia Časť 3: Pracovné kritériá a skúšobné postupy	STN EN 15267-3
	pre stacionárne automatizované meracie systémy na kontinuálne monitorovanie emisií zo stacionárnych zdrojov	83 4106

Air quality - Assessment of air quality monitoring equipment - Part 3: Performance criteria and test procedures for stationary automated measuring systems for continuous monitoring of emissions from stationary sources

Táto norma obsahuje anglickú verziu európskej normy. This standard includes the English version of the European Standard.

Táto norma bola oznámená vo Vestníku ÚNMS SR č. 03/24

Obsahuje: EN 15267-3:2023

Oznámením tejto normy sa ruší STN EN 15267-3 (83 4106) zo septembra 2008

#### 138248

Slovenská technická norma a technická normalizačná informácia je chránená zákonom č. 60/2018 Z. z. o technickej normalizácii v znení neskorších predpisov.

# EUROPEAN STANDARD NORME EUROPÉENNE EUROPÄISCHE NORM

# EN 15267-3

December 2023

ICS 13.040.99

Supersedes EN 15267-3:2007

**English Version** 

## Air quality - Assessment of air quality monitoring equipment - Part 3: Performance criteria and test procedures for stationary automated measuring systems for continuous monitoring of emissions from stationary sources

Qualité de l'air - Évaluation des équipements de surveillance de la qualité de l'air - Partie 3: Critères de performance et modes opératoires d'essai pour les systèmes de mesurage automatisés fixes de surveillance en continu des émissions de sources fixes Luftbeschaffenheit - Beurteilung von Einrichtungen zur Überwachung der Luftbeschaffenheit - Teil 3: Mindestanforderungen und Prüfprozeduren für stationäre automatische Messeinrichtungen zur kontinuierlichen Überwachung von Emissionen aus stationären Quellen

This European Standard was approved by CEN on 27 November 2023.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and United Kingdom.

## **European foreword**

This document (EN 15267-3:2023) has been prepared by Technical Committee CEN/TC 264 "Air quality", the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by June 2024, and conflicting national standards shall be withdrawn at the latest by June 2024.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN 15267-3:2007.

The main changes compared to the previous edition are listed below:

- a) The title of the revised EN 15267 series has been clarified to avoid the impression that all parts deal with the certification of automated measuring systems. The title has been generalized so that specifically Part 1 and Part 2 are also applicable to other air quality monitoring equipment.
- b) The title of revised EN 15267-3 has been clarified to make it clear that Part 3 deals with stationary automated measuring systems for continuous monitoring of emissions from stationary sources.
- c) The performance criteria and test procedures were adapted to the state of the art in measurement technology.
- d) Requirements for stationary automated measuring systems measuring mercury have been added.
- e) References have been updated.

This document is Part 3 of a series of European Standards:

- EN 15267-1, Air quality Assessment of air quality monitoring equipment Part 1: General principles of certification
- EN 15267-2, Air quality Assessment of air quality monitoring equipment Part 2: Initial assessment of the manufacturer's quality management system and post certification surveillance for the manufacturing process
- EN 15267-3, Air quality Assessment of air quality monitoring equipment Part 3: Performance criteria and test procedures for stationary automated measuring systems for continuous monitoring of emissions from stationary sources
- EN 15267-4, Air quality Assessment of air quality monitoring equipment Part 4: Performance criteria and test procedures for portable automated measuring systems for periodic measurements of emissions from stationary sources

Any feedback and questions on this document should be directed to the users' national standards body. A complete listing of these bodies can be found on the CEN website.

According to the CEN-CENELEC Internal Regulations, the national standards organisations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North

Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and the United Kingdom.

## Introduction

#### 0.1 General

The assessment of air quality monitoring equipment (AQME) supports the requirements of certain Directives of the European Union (EU), which require, either directly or indirectly, that this equipment complies with performance criteria, maximum permissible measurement uncertainties and test requirements. These Directives include Directive 2010/75/EU on industrial emissions (IED), Directive (EU) 2015/2193 on medium combustion plants and Directive 2008/50/EC on ambient air quality and cleaner air for Europe.

The assessment of AQME consists of the following sequential stages:

- a) performance testing;
- b) initial assessment of the manufacturer's quality management system (QMS);
- c) certification;
- d) surveillance for the manufacturing process.

This document specifies the performance criteria and test procedures for performance testing of stationary AMS for continuous monitoring of emissions from stationary sources. Testing applies to complete measuring systems.

The overall assessment for the purposes of certification is *conformity testing*, while the evaluation of performance against specified performance criteria is *performance testing*.

#### 0.2 Legal drivers

This document supports at least the requirements of the following EU Directives:

- Directive 2010/75/EU on industrial emissions;
- Directive (EU) 2015/2193 on the limitation of emissions of certain pollutants into the air from medium combustion plants;
- Directive 2003/87/EC establishing a system for greenhouse gas emission allowance trading.

However, this document can also be applied to the monitoring requirements specified in other EU Directives.

#### 0.3 Relationship to EN 14181

The quality assurance levels (QAL) defined in EN 14181 cover the suitability of an AMS for its measuring task (QAL1), the regular calibration and validation of the AMS (QAL2), and the control of the AMS during its ongoing operation on an industrial plant (QAL3). An annual surveillance test (AST) is also defined in EN 14181.

This document provides the detailed procedures covering the QAL1 requirements of EN 14181. Furthermore, it provides input data for QAL3.

#### **0.4 Processes**

Field testing of an AMS is ordinarily carried out on the most highly demanding industrial process in the range of applications for which a manufacturer seeks certification. The premise is that if the AMS performs acceptably on this process, then experience has shown that the AMS generally performs well on the majority of other processes. However, there are always exceptions and it is the responsibility of

the manufacturer in conjunction with the user to ensure that the AMS performs adequately on a specific process.

#### **0.5 Performance characteristics**

A combination of laboratory test and field test is detailed within this document. The laboratory test is designed to assess whether an AMS can meet, under controlled conditions, the relevant performance criteria. The field test is designed to assess whether an AMS can continue to work and meet the relevant performance criteria in a real application. Field testing is carried out on an industrial process representative of the intended application for the AMS for which the manufacturer seeks certification.

The main AMS performance characteristics are:

- response time;
- repeatability standard deviation;
- lack of fit (linearity);
- drift;
- influence of ambient temperature;
- influence of supply voltage variations;
- influence of vibration;
- influence of sample gas pressure;
- influence of sample gas flow for extractive AMS;
- cross-sensitivity to likely interferents contained in the waste gas other than the measured component;
- excursion of measurement beam of cross-stack in situ AMS;
- converter efficiency for AMS measuring NO<sub>x</sub>;
- converter efficiency for AMS measuring Hg;
- response factors for AMS measuring TOC;
- performance and accuracy of the AMS against the standard reference method (SRM) or alternative method (AM);
- maintenance interval;
- availability;
- reproducibility.

The quality of reference or surrogate materials used under QAL3 for both gaseous measured components and particulate matter measuring AMS is also assessed.

This document is an application and elaboration of EN ISO 9169 with additional and alternative provisions for paired testing. Where this document appears to differ from EN ISO 9169, it either

elaborates upon the requirements of EN ISO 9169 or differs in minor ways owing to the necessity to conduct paired testing.

#### 0.6 Relationship to EN 15267-4

This document forms the basis of EN 15267-4, which specifies the performance test of portable automated measuring systems (P-AMS) for periodic measurements of emissions from stationary sources. Many requirements of EN 15267-4 are identical to those of this document. EN 15267-4 deviates from this document only where the portable use and the use as SRM or AM require different or additional requirements. Therefore, this document allows a combined testing according to EN 15267-3 and EN 15267-4 where an AMS is designed for stationary and portable use.

## 1 Scope

This document specifies the performance criteria and test procedures for the performance test of stationary automated measuring systems (AMS) that continuously measure gases and particulate matter in, and flow of, the waste gas from stationary sources.

This document supports the requirements of particular EU Directives. It provides the detailed procedures covering the QAL1 requirements of EN 14181 and, where required, input data used in QAL3.
