Fire safety engineering

Requirements governing algebraic formulae

Part 9: Ejected flame from an opening

Ingénierie de la sécurité incendie

Exigences régissant les formules algébriques

Partie 9: Panache de flamme sortant d'une ouverture

Táto slovenská technická norma obsahuje anglickú verziu medzinárodnej normy ISO 24678-9: 2022 a má postavenie oficiálnej verzie.

This Slovak standard includes the English version of the International standard ISO 24678-9: 2022 and has the status of the official version.

140814

Úrad pre normalizáciu, metrológiu a skúšobníctvo Slovenskej republiky, 2025

Slovenská technická norma a technická normalizačná informácia je chránená zákonom č. 60/2018 Z. z. o technickej normalizácii v znení neskorších predpisov.

Anotácia

Tento dokument špecifikuje požiadavky, ktorými sa riadi aplikácia explicitných (jednoznačných) súborov algebrických vzorcov na výpočet špecifických charakteristík šľahajúceho plameňa z otvoru.

Národný predhovor

Dokumenty týkajúce sa požiarnebezpečnostného inžinierstva sú na medzinárodnej úrovni spracovávané v subkomisii ISO/TC 92/SC 4 Požiarnebezpečnostné inžinierstvo a v európskej pracovnej skupine CEN/TC 127 WG 8 Požiarnebezpečnostné inžinierstvo – angl. Fire safety engineering (ďalej len „FSE“).

Požiarnebezpečnostné inžinierstvo je určené pre nové inovatívne výrobky, návrhy, projekty a prevádzku, kde nie sú určené požiadavky požiarnej bezpečnosti stavieb.

Požiarnebezpečnostné inžinierstvo je alternatívou predpisových (právnych a normatívnych) riešení. Je zapracované v mnohých európskych a medzinárodných normách a normatívnych dokumentoch, (napr. časti eurokódov, týkajúcich sa účinkov požiaru) prijatých do sústavy STN a pokynov EÚ na požiar.

Požiarnebezpečnostné inžinierstvo sa používa v súlade s zákonom č. 314/2001 Z. z. o ochrane pred požiarimi. Národné predpisy a normy umožňujú ich používanie za špecificky určených podmienok.

Požiarnebezpečnostné inžinierstvo ako podrobné alternatívne riešenie je možné používať na návrh komplexných alebo čiastkových problémov požiarnebezpečnostného inžinierstva.

Pre správne používanie je nevyhnutná znalosť najnovších základných dokumentov FSE a spracovanie požiarnebezpečnostnými inžiniermi (pozri Národná sústava povolaní <https://www.sustavapovolani.sk>).

Tieto dokumenty FSE sú určené pre vedeckých pracovníkov, technické inžinierske vzdelávanie, architektov a stavebných inžinierov, účastníkov stavebného procesu, schvaľujúce orgány a manažment prevádzok budov a inžinierskych diel.

Normatívne referenčné dokumenty

Na nasledujúce dokumenty sa odkazuje v texte takým spôsobom, že časť ich obsahu alebo celý obsah predstavuje požiadavky tohto dokumentu. Pri datovaných odkazoch sa používa len citované vydanie. Pri nedatovaných odkazoch sa používa najnovšie vydanie citovaného dokumentu (vrátane akýchkoľvek zmien).

POZNÁMKA 1. – Ak bola medzinárodná publikácia zmenená spoločnými modifikáciami, čo je indikované označením (mod), použije sa príslušná EN/HD.

POZNÁMKA 2. – Aktuálne informácie o platných a zrušených STN a TNI možno získať na webovom sídle www.unms.sk.

ISO 24678-9:2022(E)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 92, *Fire safety*, Subcommittee SC 4, *Fire safety engineering*.

A list of all parts in the ISO 24678 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

The ISO 24678 series is intended to be used by fire safety practitioners involved in fire safety engineering calculation methods. It is expected that users of this document are appropriately qualified and competent in the field of fire safety engineering. It is particularly important that users understand the parameters within which particular methodologies can be used.

Algebraic formulae conforming to the requirements of this document are used with other engineering calculation methods during fire safety design. Such design is preceded by the establishment of a context, including the fire safety goals and objectives to be met, as well as performance criteria when a tentative fire safety design is subject to specified design fire scenarios. Engineering calculation methods are used to determine if these performance criteria are met by a particular design and if not, how the design needs to be modified.

The subjects of engineering calculations include the fire-safe design of entirely new built environments, such as buildings, ships or vehicles as well as the assessment of the fire safety of existing built environments.

The algebraic formulae discussed in this document can be useful for estimating the consequences of design fire scenarios. Such formulae are valuable for allowing the practitioner to quickly determine how a proposed fire safety design needs to be modified to meet performance criteria and to compare among multiple trial designs. Detailed numerical calculations can be carried out up until the final design documentation. Examples of areas where algebraic formulae have been applicable include determination of heat transfer, both convective and radiant, from fire plumes, prediction of ceiling jet flow properties governing detector response times, calculation of smoke transport through vent openings and analysis of enclosure fire hazards such as smoke filling and flashover. However, the simple models often have stringent limitations and are less likely to include the effects of multiple phenomena occurring in the design scenarios.

The general principles of fire safety engineering are described in ISO 23932-1, which provides a performance-based methodology for engineers to assess the level of fire safety for new or existing built environments. Fire safety is evaluated through an engineered approach based on the quantification of the behaviour of fire and based on knowledge of the consequences of such behaviour on life safety, property and the environment. ISO 23932-1 provides the process (necessary steps) and essential elements to design a robust performance-based fire safety programme.

ISO 23932-1 is supported by a set of fire safety engineering documents available on the methods and data needed for the steps in a fire safety engineering design summarized in Figure 1 (taken from ISO 23932-1:2018, Clause 4). This set of documents is referred to as the Global fire safety engineering analysis and information system. This global approach and system of standards provides an awareness of the interrelationships between fire evaluations when using the set of fire safety engineering documents. The set includes ISO 16732-1, ISO 16733-1, ISO 16734, ISO 16735, ISO 16736, ISO 16737, the ISO 24678 series, the ISO 24679 series, ISO 16730-1, ISO/TS 29761, ISO/TS 13447, and other supporting Technical Reports that provide examples of and guidance on the application of these documents.

Each document supporting the global fire safety engineering analysis and information system includes language in the introduction to tie that document to the steps in the fire safety engineering design process outlined in ISO 23932-1. ISO 23932-1 requires that engineering methods be selected properly to predict the fire consequences of specific scenarios and scenario elements (ISO 23932-1:2018, Clause 12). Pursuant to the requirements of ISO 23932-1, this document provides the requirements governing algebraic formulae for fire safety engineering. This step in the fire safety engineering process is shown as a highlighted box in [Figure 1](#) and described in ISO 23932-1.

Fire safety engineering — Requirements governing algebraic formulae —

Part 9: Ejected flame from an opening

1 Scope

This document specifies the requirements governing the application of explicit algebraic formula sets to the calculation of specific characteristics of ejected flame from an opening.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.
